Coronary Microvascular Disease: The next frontier in Ischemic Heart Disease

There is growing interest in Coronary Microvascular Disease (CMVD) and its contribution to the burden of ischemic heart disease and heart failure. We have used a genotype-first approach to show that Friend of GATA 2 (FOG2 or ZFPM2), a transcriptional co-regulator which is crucial to coronary development, is associated with CMVD. Furthermore, FOG2 may regulate a HIF-induced angiogenic program to contribute to CMVD.
